CLASS 6 — MATHS · FORMULA SHEET

Chapter 2: **Lines and Angles** | Quick revision, one page

Basic figures

- Line segment: two end points, fixed length. Ray: one end point, goes on forever in one direction. Line: no end points, extends both ways.
- n points on a line give $\dfrac{n(n-1)}{2}$ line segments.

Types of angles

- Acute: $0^\circ < \theta < 90^\circ$. Right: $\theta = 90^\circ$.
- Obtuse: $90^\circ < \theta < 180^\circ$. Straight: $\theta = 180^\circ$.
- Reflex: $180^\circ < \theta < 360^\circ$. Complete angle (full turn): 360°.
- Quarter turn $= 90^\circ$; half turn $= 180^\circ$; three-quarter turn $= 270^\circ$.

Clocks

- Minute hand: 360° in 60 min, i.e. 6° per minute.
- Hour hand: 360° in 12 h, i.e. 30° per hour.
- At h o'clock the angle between the hands is $30h^\circ$; if this is more than 180°, the smaller angle is $360^\circ - 30h^\circ$.

Measuring and adding angles

- Protractor: place the centre on the vertex and the base line along one arm; read the scale that starts from 0° on that arm.
- Adjacent angles add up: $\angle AOB + \angle BOC = \angle AOC$.
- A bisector divides an angle into two equal parts: a 60° angle is split into $30^\circ + 30^\circ$.
