CLASS 6 — MATHS · FORMULA SHEET

Chapter 4: **Data Handling and Presentation** | Quick revision, one page

Collecting and organising data

- Data: information collected as numbers or facts. Tally marks: groups of five (four strokes crossed by a fifth) make counting easy.
- Frequency: the number of times a value occurs. A frequency table lists each value with its frequency.
- Total of all frequencies = total number of observations.

Pictograph

- One symbol stands for a fixed number of items (the key). A half symbol stands for half that number.
- Number shown = (number of symbols) × (value of one symbol).
- Number of symbols needed = (quantity) ÷ (value of one symbol).

Bar graph

- Bars have equal width and equal gaps; the height shows the quantity on a chosen scale.
- Quantity = bar height × scale value (e.g. 4 cm at 1 cm = 20 gives 80).
- Bar height = quantity ÷ scale value.
- A graph needs a title, labels on both axes, and the scale written clearly.

Reading data

- Most popular: highest frequency (the value that occurs most often). Least popular: lowest frequency.
- Difference between two items: subtract their values. Total: add all the values.
