CLASS 6 — SCIENCE · FORMULA SHEET

Chapter 4: **Exploring Magnets** | Quick revision, one page

Magnetic and non-magnetic

- Magnetic: iron, nickel, cobalt (and steel).
- Non-magnetic: wood, plastic, glass, copper, paper, rubber.

Poles of a magnet

- Every magnet has two poles: north and south.
- Attraction is strongest at the poles.
- Poles cannot be separated: cutting a magnet gives two magnets.

Rules of attraction

- Like poles repel (N-N, S-S).
- Unlike poles attract (N-S).
- Repulsion is the sure test for a magnet; attraction alone is not (iron is also attracted).

Direction and uses

- A freely suspended bar magnet rests in the north-south direction.
- A magnetic compass has a small magnet needle that points north-south.
- Uses: compass, fridge and door catches, magnetic toys, separating iron from waste.
- Shapes of magnets: bar, horseshoe, ring, cylinder.
