CLASS 6 — SCIENCE · FORMULA SHEET

Chapter 5: **Measurement of Length and Motion** | Quick revision, one page

Units of length

- SI unit: metre (m).
- 1 m = 100 cm. 1 cm = 10 mm.
- 1 km = 1000 m.
- Non-standard units (cubit, handspan, footstep) differ from person to person.

Measuring length

- Short lengths: ruler. Body and cloth: measuring tape.
- Curved line: use a thread, then measure the thread on a ruler.
- Place the zero mark at the start; keep the eye directly above the mark.
- Avoid using a broken end of the scale.

Types of motion

- Linear: straight line (a car on a straight road).
- Circular: along a circle (a stone whirled on a string).
- Rotational: spinning about its own axis (a top, a fan).
- Periodic: repeats after equal times (a pendulum, a swing).
- Random: no fixed pattern (a flying butterfly).

Remember

- Motion = change of position with time.
- Rest: no change of position.
- Oscillation: to and fro motion about a mean position.
