CLASS 6 — SCIENCE · FORMULA SHEET

Chapter 8: **A Journey through States of Water** | Quick revision, one page

States of water

- Solid: ice. Liquid: water. Gas: water vapour (invisible).
- Water can change from one state to another when heated or cooled.

Changes of state

- Melting: ice to water (0 degrees C).
- Freezing: water to ice (0 degrees C).
- Evaporation: water to vapour, at any temperature, from the surface.
- Boiling: water to vapour throughout the liquid at about 100 degrees C.
- Condensation: vapour to water on cooling.

Factors affecting evaporation

- Higher temperature: faster.
- Larger surface area: faster.
- Wind or moving air: faster.
- More humidity (moisture) in the air: slower.

Water cycle

- Evaporation, then cloud formation, then rain or snow, then flow back to rivers and sea.
- Clouds are tiny droplets of water and ice crystals.
- Dew and mist are formed by condensation.
