CLASS 6 — SCIENCE · FORMULA SHEET

Chapter 9: **Methods of Separation in Everyday Life** | Quick revision, one page

Methods for solid mixtures

- Handpicking: large pieces of different kinds (stones from rice).
- Winnowing: heavy grain and light husk, using wind.
- Threshing: separate grain from stalks by beating.
- Sieving: different particle sizes (flour and bran).
- Magnetic separation: iron objects from non-magnetic ones.

Solid in liquid

- Sedimentation: heavier insoluble particles settle down.
- Decantation: pour off the clear liquid slowly.
- Filtration: filter paper or cloth keeps the residue; filtrate passes through.
- Evaporation: dissolved solid left behind (salt from sea water).

Other methods

- Condensation: vapour cooled to liquid.
- Churning: separates butter from curd or cream.
- Evaporation then condensation can give pure water from salt water.

Choosing a method

- Look at size, weight, solubility and magnetic nature of the parts.
- Dissolved solid: evaporation. Insoluble solid in liquid: sedimentation and filtration.
