Mistakes to avoid:

- Using a clinical thermometer for hot water or for a room; it is only for the **human body**.
- Not shaking the clinical thermometer before use, so an old reading is mistaken for the new one.
- Letting the bulb of the laboratory thermometer touch the beaker, or reading it from a slant.
- Believing that our hands can measure temperature accurately; touch can be **misleading**.
- Writing that cold flows from ice to a hand; **heat** flows from the hotter to the colder object.
- Writing the wrong units or values: body temperature is about 37 degrees C, not 100 degrees C.

Evaluator's note: Award step marks as shown; accept any correct alternative method. In internal-choice questions, evaluate only the option attempted. Deduct up to ½ mark for missing units or figures where required.
