ANSWER KEY & MARKING SCHEME SET 1

Chapters 1–5: **A Square and a Cube, Power Play, A Story of Numbers, Quadrilaterals, Number Play** | Class 8 Maths | Maximum Marks: 50

SECTION — A (Objective Type) — Answers — 15 × 1 = 15

Q.	Correct Option	Brief Reasoning
1	**(a)** 15	Squares from 15^2 to 29^2
2	**(a)** 2^8	$2 \times 2^7 = 2^8$
3	**(d)** 5	$3b + 4 = 19$
4	**(b)** 90°	One part $= 18^\circ$
5	**(a)** 41	LCM plus the common remainder
6	**(d)** 62	Next square is $36^2 = 1296$
7	**(b)** 4	$2x + 1 = 9$
8	**(c)** 5	Number of binary digits of the largest weight to be measured
9	**(c)** 60°	$x + 2x = 180$
10	**(a)** 57	71 multiples up to 500 minus 14 multiples below 100
11	**(b)** 77	Previous square is $50^2 = 2500$
12	**(d)** 7	$2^4 \times 5^7 = 10^4 \times 125$
13	**(a)** Both A and R are true and R is the correct explanation of A.	$1296 = 2^4 \times 3^4$, every exponent is even, so it is a perfect square (36^2); R is the test that explains it.
14	**(a)** Both A and R are true and R is the correct explanation of A.	$2^{-3} = \frac{1}{2^3} = \frac{1}{8}$; R is exactly the rule used.
15	**(a)** Both A and R are true and R is the correct explanation of A.	$1 \times 4 + 0 \times 2 + 1 \times 1 = 5$; R is the method used.

16	Next square 3969 (1); add 69, root 63 (1).	1+1
17	$243 = 3^5$ (1); $2x - 1 = 5$ gives $x = 3$ (1).	1+1
18	$2b + 3 = 13$ (1); $b = 5$ (1).	1+1
19	Opposite angles equal gives $x = 12$ (1); $\angle A = 62^\circ$, so $\angle B = 180 - 62 = 118^\circ$ (1).	1+1
20	LCM(20, 25) $= 100$ (1); number $= 100 + 3 = 103$ (1).	1+1

26	(i) $1764 = 2^2 \times 3^2 \times 7^2$ (1). (ii) Side $= 2 \times 3 \times 7 = 42$ m (1). (iii) Perimeter $= 4 \times 42 = 168$ m; cost $= 168 \times 50 =$ ₹8,400 (1). (iv) New area $= 45^2 = 2025$ m^2; extra area $= 2025 - 1764 = 261$ m^2 (1+1).	1+1+1+2
27	Digits are all less than b, so $b > 4$ (1); $2b^2 + 3b + 4 = 69$ (2); trying $b = 5$ gives $50 + 15 + 4 = 69$ (1); so $b = 5$ (1).	1+2+1+1

	OR: One part $= 360 \div 10 = 36^\circ$ (1); angles 36°, 72°, 108°, 144° (2); $\angle A + \angle D = 36 + 144 = 180^\circ$ (1); these are co-interior angles, so AB $\parallel$ DC (1).	1+2+1+1

ANSWER KEY & MARKING SCHEME SET 2

Chapters 1–5: **A Square and a Cube, Power Play, A Story of Numbers, Quadrilaterals, Number Play** | Class 8 Maths | Maximum Marks: 50

SECTION — A (Objective Type) — Answers — 15 × 1 = 15

Q.	Correct Option	Brief Reasoning
1	**(a)** 29 and 30	$(n+1)^2 - n^2 = 2n+1$ gives $n = 29$
2	**(c)** 3	Ones digits repeat in the cycle [7, 9, 3, 1]
3	**(b)** 4	77 = 1001101_2
4	**(b)** 50°	$\angle AOB = 180 - x$; OA = OB, so $\angle OAB = x/2$
5	**(b)** 111	Test palindromes 101, 111, 121, ...
6	**(a)** 3	A k-digit square has $\lceil k/2 \rceil$ digits in its root
7	**(d)** 27	$x = 5$, so 3^3
8	**(b)** MCMXCIV	Break 1994 into thousands, hundreds, tens and units
9	**(a)** 110°	$\angle A + \angle D = 180^\circ$ gives x; base angles $\angle C = \angle D$
10	**(b)** 1	Divisible by 10 and 9
11	**(a)** -9	$(-9)^3 = -729$
12	**(b)** $\frac{6}{5}$	$\left(\frac{1}{2} + \frac{1}{3}\right)^{-1}$
13	**(a)** Both A and R are true and R is the correct explanation of A.	Co-interior angles between parallel lines add up to 180°, which gives A.
14	**(a)** Both A and R are true and R is the correct explanation of A.	$4 + 2 + 3 + 6 = 15$, which is divisible by 3; R is the test used.
15	**(b)** Both A and R are true but R is not the correct explanation of A.	$(2k)^2 = 4k^2$ is even, so A is true; R is also true ($1 + 3 + 5 = 9 = 3^2$) but it does not explain A.

Chapters 1–5: **A Square and a Cube, Power Play, A Story of Numbers, Quadrilaterals, Number Play** | Class 8 Maths | Maximum Marks: 50

SECTION — A (Objective Type) — Answers — 15 × 1 = 15

Q.	Correct Option	Brief Reasoning
1	**(c)** 3	7^3 ends in 3
2	**(c)** 0.5×10^6	Convert each to usual form and compare
3	**(c)** 3	The last place has value 3, so the number is a multiple of 3
4	**(b)** isosceles trapezium	Isosceles trapezium has equal diagonals
5	**(c)** 99	9 and 11 have no common factor
6	**(b)** 33	$14 + 19 = 33$
7	**(b)** 40	$2^{x+3} = 2^x \times 2^3$
8	**(c)** 6	$2b + 5 = 17$
9	**(c)** 120°	One part $= 30^\circ$
10	**(b)** 67	LCM plus the common remainder
11	**(b)** 23	Squares from 32^2 to 54^2
12	**(c)** 3^6	$3 \times 3^5 = 3^6$
13	**(b)** Both A and R are true but R is not the correct explanation of A.	An odd power of -1 is -1, so A is true; R is also true but is unrelated to the value of $(-1)^{101}$.
14	**(b)** Both A and R are true but R is not the correct explanation of A.	XL = 50 − 10 = 40, so A is true; R is also true but does not explain why XL means 40.
15	**(b)** Both A and R are true but R is not the correct explanation of A.	Both are true, but bisecting does not give equal lengths; equality follows from the right angles of the rectangle.
