CLASS 7 — MATHS · FORMULA SHEET

Chapter 5: **Parallel and Intersecting Lines** | Quick revision, one page

Pairs of angles

- Complementary angles: sum $= 90^\circ$; the complement of x is $90^\circ - x$.
- Supplementary angles: sum $= 180^\circ$; the supplement of x is $180^\circ - x$.
- Linear pair: two adjacent angles on a straight line; they are supplementary.
- Angles around a point: sum $= 360^\circ$.

Intersecting lines

- Two lines crossing form four angles; vertically opposite angles are equal.
- Adjacent angles at the crossing form a linear pair: sum $= 180^\circ$.

Parallel lines and a transversal

- A transversal is a line that cuts two (or more) lines at different points and forms eight angles.
- If the lines are parallel: corresponding angles are equal; alternate interior angles are equal; same-side interior angles add up to 180°.
- Of the eight angles, there are only two different values, and they add up to 180°.

Test for parallel lines

- If a pair of corresponding angles, or a pair of alternate interior angles, is equal, or a pair of same-side interior angles is supplementary, then the two lines are parallel.
